Communication thru  
Slack

## Page 1 - Jan 14

---

Tuesday, January 14, 2025 3:24 PM

Todo ☐

- By next Tuesday, fill out Term Project Plan file
- meet with team first
  - send doc to Carl/Moon

## Page 2

Friday, January 24, 2025 1:03 PM

- Dividing roles:
  - UI design
  - Backend (db, etc.)
  - Algo research/survey design

Credit Hour Delegation:

- more credit hours take leadership role in subteam

✓ Draft up MVP → text input, stored into db

- Typescript w/ react, tailwind
- Devic DB for local database

Class 1/28

- Prepare brainstorming questions
- Assign roles for subteams/credit hour assignment
- No major need for db → use dummy data, so look into ai module

## Page 3

Saturday, February 8, 2025 3:29 PM

2/4 class:

Created demo for AI integration in project - link in Slack

Work on touching up UI, change from random metrics from text to model predictions - Kunlin

Demo -  
text input, AI analyzes text and provides metrics on friendliness, socialness, etc.  
can use these metrics to help make/adjust groupings.

Work for this week:

- I incorporated models from HuggingFace for text analysis
- Updated react frontend to metrics that those models provide

2/11 class

Demo:

- Figure out how to segment w/ algo team
- Touch up on model output and decide which metrics are most suited for making groups
- Incorporate benchmark for text - must be robust enough to do proper analysis

2/16-17

- Created test plan for subteam
- Metric and logic/algorithm testing
- Potentially explore relevant datasets (opensource resources such as kaggle, etc.)
- Create some sort of ground truth or control group based off successful groupings to serve as testing for algorithm created groups

2/18: work day in class

- Look into utilizing ai component for identifying personality type, so here can ask user for some text --> then give their personality type result
- Can incorporate this into algo team --> to help determine groups, look into working w/ relevant people for this
- Check dummy data and how to consider using that for AI module

2/24

- Implemented metrics for ai component --> focused mostly on confidence scores on each analysis output given by each model
- Testing metrics for confidence of analysis
- Confidence scores for each emotion from model, as well as type of toxicity
- Token/msg statistics, could help with identifying bottlenecks, as well as processing/latency issues
- Can work on testing actual metrics and usefulness once integration with algorithm team
- Model transparency: model documentation and interpretability could be analyzed with third pty model

## Page 5

Tuesday, March 04, 2025 9:43 AM

2/28

- Work with algo team to incorporate ai module into personality component of algorithm
- Set base complexity/text needed for user to submit text for analysis, based on needs of algo team for personality trait
- Base complexity metrics: character length, complexity based on current metrics (using existing sentiment analysis models)
- Testing with mock text data – created expected versus actual, and display via react component (dashboard view)
- Work to create slideshow to present test design/development and results of testing

March 3 class test demo

- Potentially incorporate personality frameworks into analysis, then can use these standard personality types to help determine grouping/compatibility -> done, used mbti framework with custom algo to determine personality type based on metrics from text
  - Use this flask server to be called from frontend of demo, incorporate as part of personality metric in grouping algo

3/25 class

- Crowdsourced systems risk--> eg for financial markets, people who are louder tend to bias system in their perspective, compromises system as these ppl don't necessarily know the most
- TMS and collective intelligence --> organizational adaptability
- Can simulate collective swarm by augmenting collective intelligence w ai

4/1 class

- Work on final presentation
- Did slides for ai group, incorporated slides from testing presentation as well as goal and approach of the ai implementation
- Properly set up and hosted the demo on github pages for easy live demo for presentation

4/7 class

- Refined final presentation, set up speaking roles and assignments
- Tested various templates for the demo to speed up presentation (various types based on the character – Francis Loeb), to have some sort of ubiquitous theme in the demo as well

4/14

- Recorded and setup video demo with prompt
- Issue with connecting flask and react in github pages deployment, so to keep presentation smooth and not change devices went with video demo

Final ai module demo repo (code):

<https://github.com/bryanmzeng/ai-module--demo-vip/tree/main/app>
