- identify the goals of what we're trying to solve
Build a cohesive plan with baseline implementations for CareerCorps — a tool that connects military spouses to their community and boosts their career confidence.
Improve upon the personalization component of the application
 - add more relevant fields
 - connect spouses to previous users with success based on their preferences
 - allow for a filtering of mentorship before settling on one
- longterm ambitions
- grow the sketch in some direction that we haven't done yet
 - free reign
 - diagram format —figma

Thinking about expanding on last year's product.

What is it that the user is going to need? How can our tools help with our larger goals?

1. In person support group
2. Recruit currently employed military spouses
 - a. seeing people in your shoes can build confidence —testimonial
 - b. what is the incentive for those people?
3. Wider net of support
 - a. childcare, local suggestions/recommendations, sports
 - b. builds a sense of trust / breaks the ice
 - c. how do you provide this? potential connection to the in person support group
4. Company Engagement
 - a. reasoning —hiring new people
 - b. build a network of trust
 - c. a physical event with in person conversations is more hopeful

FUTURE STEPS:

- do research on resources

- answer the above questions

Carl's aspiration: In two weeks, start to have a concrete idea of what we're going to be building this semester.

Moon: taking pieces we've built on a test run, looking for improvements

▼ simultaneously work on expanding 'previous user' network / community & company relations

▼ the concern about incentives for users to come back and provide mentorship or aid to new users could be addressed by referral benefits

▼ referrals could be boosted if the platform worked on company engagement

▼ capitalizing on government aided education

▼ myCAA -

What exactly do we want from “personalized plan for goals”?

Come up with several concrete things we can do with that idea.

Moon’s suggestion - use Anita’s diagram and pinpoint where in the diagram the personalized plan can come in. What is the functionality or feature that this represents?

Carl’s suggestion - gap analysis between job description and user experience, express to the user improvements.

- could utilize the matching script built out with AI last year from my group

WRITE SOMETHING INTO SLACK CHANNEL BY FRIDAY.

READ SUBMISSIONS OVER THE WEEKEND.

“Personalized Plan for Goals”

As per Moon’s suggestion, I looked at Anita’s diagram for guidance on where the ‘personalized plan’ can come in. I think the profile segment is well-organized and can be the basis or first step in the personalization process. To add to resume and mentor match info, I think desired resources, goals, and experiences can be an input.

I know we mentioned AI as a tool to generate the plan. We can build off of last semester’s AI mentor group which did more than just give tips. I recall the

subgroup asking it to generate suggestions on future steps. Additionally, my recommendation group last year was able to have the gpt output ways to buff up their profile for certain job recommendations. This is the 'gap analysis' that Carl mentioned.

I think these two things coincide. We can combine them by including nearby jobs to the AI's consideration (as the recommendation group did) when generating a plan. This will allow the plan to be geared towards real jobs near the user and improvements they can make to get them.

A plan could look like support from an AI mentor, previous user, or real mentor based on user's preferences (or none if job applications are the only thing the user is looking for). This relates to Anita's mentor hub. Regardless of the person/robot the user is chatting with, I think communication can all be 'cohesive' in one main channel to keep things simple. We can even include a meeting scheduling sidebar. The plan also has a constructive list of to-dos. I think this may be more generalizable than the homework hub? The itemized to-do list could navigate the user to the communication page. I'm not entirely sure what the actual educational component would look like.

Regarding the community aspect, I think we can start simple by grouping previous users by occupation type or field. If community is an indicated preference in the user's profile, then the plan can point them to an existing community.

If we want to incorporate the metadata of previous users / companies that have hired from CareerCorps, then that would likely need to be stored somewhere. Whenever a user is seeking a field or company that a previous user has worked, the AI can compare the user's resume to the previous user's resume —the same way it does when comparing resumes to job descriptions.

Since I worked in the recommendation script last semester, I could help out in combining that with the personalized plan, if we want to go in that direction.

Personal Focus: mentor client workflow

Other groups and discussions: goal setting & ai gap analysis

- Gap analysis is the assessment.
- jade: there are multiple subgoals / constructive steps
- moon: label different types of gaps not just by known of unknown but also structurally (certification, class, experience, skill)
- carl: expand to unrealized gaps
- carl: look at open source tools / fork and make changes to build off of
- group: defined the goal of us developers being less focused on acquiring a job
 - I think it's important to tie it back to military spouse so it's not just a general job mentoring application.
 - Also, the conversation about validating that the mentorship is successful can be addressed by looking at successful clients.
 - matching steps to the goals through observation of past clients

Future to-dos

- take a look at the open source tools moon posted on slack
- get a grasp of the flow of the app similar to moon's acs service inquiry view

- having it in phases of the workflow (the horizontal organization) as well as the actors (vertical)
- afr datax process map is data-centralized, consider drawing from this

Ideas for upcoming week:

- incorporate crowdsourcing, thinking of incorporate previous users' experiences
- work on AI agent, Geeta has a baseline
- look at open source tools
- Moon: combine user flows/diagrams (mine with Jade's)
 - Carl: others can dive into mine and expand
- Moon: specify where the human mentor gets involved
